

Criticality of the marginal drug Kakutani index (DKI): $q_i = p + c i^{-\alpha}$, $p = 0.5$, $c = 0.1$

A $\log_{10} K_N$ vs $\log_{10} N$: power law / logarithm / finite limit

B Critical point $\alpha_c = 1/2$: $K_N \sim \frac{c^2}{4p(1-p)} \ln N$

C Phase diagram $\gamma(\alpha)$

D Collapse of the Kakutani affinity Π_N
